

Space and time on Earth What do we exist relative to?

The system of physical quantities on Earth is built so that no one can disrupt the operation of Control Systems and is standard relative to the base.

Any system of physical quantities is constructed relative to any parameter. The physical quantities accepted on Earth - mass, meter, degree (angular), second, candela, etc., - are a consequence of binding to one parameter - **the gravitational frequency of the 63.5rd octave (includes 64 base frequencies)**, which is the base in the System. All physical quantities known on Earth were formed relative to this octave.

The principles of the formation of physical quantities were recorded by the Sumerians, the Dogons (a pendulum was used). Thus, a second, a meter, and a mass were formed. Gravitational tires were laid on Earth (in the physical encyclopedia - "magnetic"), the number of tires = 8,640,000 (there should be exactly 86,400 seconds in a day = $24 \cdot 60 \cdot 60$), that is, there are exactly 100 tires per 1 daily second.

The HALOK metric system was used for the initial formation, but it turned out to be not entirely acceptable for the Earth, however, some parameters were taken from it [60]. Despite the redundancy and lack of clarity, the 10th number system is used (along with the 3rd, 6th, 8th, 12th). However, the Complexes of the System left in the Automata only systems for calculating and working with octaves no higher than 64, because everything above this octave is called mental and astral fields. Modern physics still works in a flat version of the physical representations of the construction of space-time and cannot switch to another representation due to the lack of material and scientific basis. On Earth, there was a control system built on a cubic basis, but it was never used as an information system. The first thing that was done during the rebuilding of the Earth Control Systems was the installation of their own control using existing forms.

For this purpose, the cubic lattice was converted into an informational lattice, and since the maximum octave = 64 (in Control and Management Systems), and this is the known size of an atom, about 0.8 angstroms, the formation of general control could not affect the foundations of physical structures, they received a different form, while remaining structures with zero potential. In the range of 63-64 octaves ($2^{63} = 9,223,372,036,854,775,808$, $2^{64} = 18,446,744,073,709,551,616$) we have only about 3 million primes with known properties. This is not much for building autonomous biological systems, and even more so for Control and Management Systems. Therefore, all captured structures strive to preserve as much as possible, making modifications only to Control and Management Systems. Some of the changes made in biology have already "eaten up" more than 2.9 million available primes, and after entering the 71st octave, further progress becomes impossible. Combining prime numbers to build new structures is dangerous from the point of view of random coincidences in uncontrolled processes that can occur as a catastrophe and an avalanche collapse of everything newly created and tested in the laboratory.

According to well-known studies, all parameters of Celestial Mechanics are strictly quantized relative to octave 63.5 - these are distances, orbits, communication and retention tubes, information systems. They all work in the frame of reference that was introduced. To enter control functions, a flat

64*64 matrix is used (the task "the number of options for traversing the chessboard with a knight"), but this matrix contains only a few tens of trillions of solutions, which is not enough to perform all management and control tasks. There is no other system.

A system for building gravity

Consider the following series of octaves:

7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31,

33, 35, 37, 39, 41, 43, 44, 45, 46, 47, 49, 51, 53, 55, 57, 59, 61, 63,

65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127.

Octave 7 is the lower limit of existence of structures on the Earth, when the frequency decreases at least by hundredths of a percent, infrasound waves occur in structures with octave 7, destroying first of all the brain.

The entire first and second rows are accessible to Control Systems, the 63rd octave is the atom familiar to everyone, the periodic table and everything that is known to modern science. The third row is not available to the Automata of Control Systems, although space and time are constructed relative to 127 octaves. Special treatment is given to the 3rd row. Here are all the mental and astral fields marked by weak and strong influences and unknown in nature.

It has been established that all structures on Earth have a strict hierarchy, especially in the atomic structure. In total, we have 44 groups (plus the first 3 groups that are not included in the sphere of life). Each group is a system constructed from an outer dodecahedron and an icosahedron inscribed into it (with the same edge). The dodecahedron and the inscribed icosahedron are connected to each other by pyramids that work like a "trigger".

If we take the 63rd octave and the size of the atom - 0.8 angstrom, then the following structure (inscribed) has a size smaller than the square of the golden ratio. The structures are also connected by pyramids, but the potential flows are only one-sided (like a diode). So, in total - 44 structures. Atom size = $542424 \cdot 10^{-13}$ mm.

Having a known shape and size of the atom, let's consider the space-time characteristics, as well as the lifetime in the structure.

The constant "square of the golden ratio" = 0.381966011250105151795413165633.

Reverse value = 2.618033988749894848204586834365.

For octave 63, a lifetime of 124 years (3913142400 sec) has been established.

The energy characteristics of the brain are given in the last column, dimension = volt/meter 3. These are the energy parameters of the charge when the charge potential density of 100% and the charge jacket density of 100% are reached. It is not surprising that many sea creatures can be used as spare batteries (on submarines) - stingrays, eels. On Earth, some bacteria glow (fireflies). All this happens due to the scattering of charges from high octaves into lower ones.

By the way, when you stroke a tiger, the electrification of your hand is higher than when you stroke its skin.

After the dissipation is complete, the biostructure disappears. There are limiting ratios for normal brain function. Some of them are described by D. Swift ("Gulliver's Travels"), where the maximum age for normal mental activity is determined (80 years). Note that for octaves above 63, the charge capacity is given relative to the 63rd octave. If the power of the 95th octave is the same

12.8428 V/m³, then all biostructures with a brain below the 73rd octave (with a full "life sphere") will be destroyed, with an incomplete one - they will be at the level of Pithecanthropus.

The 95th octave - the size of the 44th structure and its lifetime, as well as the charge power relative to the 63rd octave. Not all biostructures have the ability to overflow. If this is not possible, then the brain exists up to the limit parameter, and the biostructure itself - due to the flow of power from lower octaves - bones, muscles. This is a secondary overflow, while the potentials of the cubic control lattices are reset and 12 external dodecahedral structures are combined into one to form a "dummy" - a phantom of the "ball of life", which has only parasitic properties. The resulting structure resembles a soccer ball in shape, and the structure resembles a carbon molecule C_{60} (called "AIDS" by housewives). Such a formation can also occur in an infant as a result of eating genetically transformed foods. By the way, the concept of "AIDS" and a soccer ball with carbon C_{60} ribs appeared simultaneously in 1976 (it is generally believed that AIDS was imported from Africa - this is true, since all experiments begin there).

In 1976, there was an extraordinary increase in the power of the octaves 55-63.

It can be seen from the table that there is no life below the 33rd octave, but the 31st octave is the limit of all imported Control Systems.

In addition, due to the fact that octave 63 has a life span of 124 years, a reincarnation system was introduced for quite a long time, which was not directly necessary.

Before the capture of the Earth, the inhabitants of the Earth had a life span of over 1,200 years (71st octave).

The lifespan of the structure (life sphere) = 603985028 years (603 million years!), that is, quite sufficient to bring the "golden million" from Sur.

In addition, each of the 44 structures has a number of options (for building Control Systems) of more than 10^{45} .

It is clear from the table that the smaller the octave of the life sphere involved, the shorter the lifespan. The lifespan is indicated taking into account the full-scale operation of the entire dodecahedron - icosahedron structure in the absence of potentials on the control grids.

Let's consider separately the issue of quantization of the energy power of the charge. It is generally accepted that the higher the charge power, the smarter the person. This is approximately true, and as the charge power decreases, the person becomes stupider. There are limiting conditions for the existence of the charge. If the charge power exceeds the upper limit, annihilation occurs, or spontaneous combustion of the biostructure and its complete destruction. Since 1986, the "New Russians" Program was launched (completed in 1990), while the charge power was increased to the norm, which corresponded to the 65th octave, according to the norm, 63rd octave. The "New Russians" turned out to be smarter, but their brain works at the upper limit parameters. The brain of the cat "Behemoth" (Bulgakov, "The Master and Margarita") corresponded to the 87th octave, and there was a power of 12.8428 V/m³, in the 63rd octave it did not exist, it was an ordinary "pollution". That is, when the octave of existence increases, the space of existence also changes. Therefore, the experiment of 1986 - 1990 must be recognized as unsuccessful, since it is impossible to increase the octave of the brain without changing the space of existence, that is, gravitational values should also be at the 65th octave, and this changes not only optics, but also all previously established parameters of Celestial Mechanics.

According to the Program, the completion of which is planned for 2012, the transition of the "golden million" (1,200,000 people) to the 71st octave is expected. However, without changing the space, it will be a disaster, since already at the 65th octave we have the limit of the existence of the

charge. By the way, there are less than 1,000,000 matrices left, so not everyone will receive them (the queue for shirts).

In circuses, they sometimes show tricks with calculations. These tricks are based on the example of Koreiko ("The Golden Calf") - a person in a familiar environment had his charge power increased and he became smarter. The same thing happens in society - certain individuals (regardless of nationality and race) receive additional power and receive Nobel Prizes. Note that the accepted ratios are established for structures that have a "Ball of Life" (considered separately). Below the 31st octave, we have only beta decay.

Beta decay also occurs in high octaves, "drums" also have an aura, but it is beyond optical perception.

Conclusions.

-- It is impossible to increase the charge power of a structure without knowing its characteristics.

-- When the octave of the brain's existence increases, it is necessary to change the gravitational octaves.

-- The pseudo-installation of 71 octaves can turn into a disaster not only for the "golden million" and its complete destruction, but also for all 12 tribes on which experiments are carried out on the final setting of charge power values.

-- The transfer of Control Systems to pseudo-octave 71 by quantization of 63 octaves is unacceptable, since any command can be decrypted (prime numbers of 71 octaves could not be obtained).

After the Launch of Moshiach's brain, Programs will immediately be launched that provide for a change of Space, therefore, the first step will be to move all the satellites of the planets to the Sun for safety purposes and recalculate the entire Motion System of the Solar System. When changing the space, the optics will change (and representatives of the "golden million" will sometimes see their phantoms instead of their favorite yachts).

PS. Some comments on known technical parameters.

-- 12 volts - most often used in lighting devices.

-- 12 - the most favorite number - 12 students, 12 months, etc.

-- 18 digits in the 63rd octave, and all computers have 18 digits (the number of signs available for processing).

-- 220 volts are the maximum value for the brain, but this is a linear value, when translated into octaves it corresponds to the limit of charge power in the 65th octave.

-- Favorite game - chess, although only 4 solutions are known for a knight to go around a chessboard. Purpose unknown.

The list can be continued, but the main thing is that this whole pile contains everything, and if you sort it out and put it together, you will get much of what is used by the Control System. There is only one thing missing - the theory of the golden section. From Pythagoras they jumped to differential and integral calculus. There is also no theory of prime numbers.

They are the basis for understanding all the processes and transformations occurring on Earth. In addition, there is no theory of Phyto-functions as the main function for the formation of biostructures.

Science knows everything about the living cell (there is a report that DNA, RNA have already been deciphered, and 95% of the living cell is known).

However, it is unknown what it consists of. Let's imagine a conveyor belt at a car assembly plant. DNA and RNA are the conveyor belt itself, and the cell is what comes off the conveyor belt (when examining the conveyor belt, the products may not be noticed), and if you add a few wheels, the conveyor belt itself will remain the same, and at the exit, instead of a passenger car, there may be an armored personnel carrier. Example 1. The function $y = xx$ is the main function for controlling the limit parameters of all biostructures. What is known about it? Only that it cannot be integrated. And what function is its antiderivative? Something is not worked out in the integral calculus

Example 2. Mathematics does not know that the accuracy and correctness of any calculations are checked using the golden section.

Example 3. Mathematics does not know that the solution of cyclic problems relates to a linear function (modern mathematics uses enumeration of options), and the solution time does not depend on the dimension of the problem.

Example 4. The function $y = \sin x$ and the golden section are interconnected.
